

Your debt. Their liquidity.

A marketplace for third-party Aave debt repayment. Keep your collateral. Let providers compete. Pay for the authenticated result.

Repayment without selling collateral.

A borrower with liquidity on Creditcoin can request repayment of an existing Aave USDC debt on Sepolia. Providers quote a total CTC reimbursement for a fixed repayment target. No invented dollar conversion; the borrower chooses the quote.

A debt obligation, not a transfer.

Fund a capped request on Creditcoin → choose a provider → the provider repays Aave through CureRouter → Attestcoin authenticates the receipt → escrow credits the selected provider. Unused budget becomes borrower credit.

Source debt reduction and destination settlement are separate confirmations.

Proof is the payment authority.

The native Creditcoin verifier authenticates a source receipt. CureBid then requires successful execution, the approved router outcome and matching Aave repayment log, exact parties, amount, deadline and request domain. Relayers cannot redirect reimbursement.

Late proof must not steal a payment.

CureRouter records either Repaid or Expired for the full terms digest. Assigned escrow can pay from a proven repayment or refund from a proven expiry. A timer alone cannot refund away an honest provider's reimbursement.

Repayment and refund, proven.

Request 1: 3 USDC repaid on Aave, then 0.07 CTC reimbursed and withdrawn through native proof. Request 2: genuine source expiry, proof-backed refund and withdrawal. Canonical escrow has zero reserved funds and zero credits. 48 contract tests, 16 TypeScript tests and 8 browser tests pass.

Win on verifiable execution.

The recorded UI walkthrough shows actual request states and public receipts. Deployed `eth_call` tests reject replay, provider substitution, request substitution and the wrong chain key. Provider A offered 0.07 CTC; Provider B offered 0.09 CTC. Team details and organiser submission remain user-supplied.
